

- 1 . What part of a cable normally bears stress along its length?
 - a. the fiber
 - b. the plastic coating of the fiber
 - c. a strength member** pg. 175
 - d. metallic armor
 - e. all of the above
2. Cables cannot protect fibers effectively against
 - a. gnawing rodents.
 - b. stresses during cable installation.
 - c. careless excavation.** Pg. 175
 - d. static stresses.
 - e. crushing.
3. Light-duty cables are intended for use
 - a. within office buildings.** Pg. 175
 - b. in underground ducts.
 - c. deep underground where safe from contractors.
 - d. on aerial poles where temperatures are not extreme.
4. The special advantages of plenum cables are what?
 - a. They are small enough to fit in air ducts.
 - b. They meet stringent fire codes for running through air spaces.** Pg. 179
 - c. They are crush resistant and can run under carpets.
 - d. They have special armor to keep rodents from damaging them.
5. Outdoor cables are not used in which of the following situations?
 - a. suspended overhead between telephone poles
 - b. tied to a separate messenger wire suspended between overhead poles
 - c. inside air space in office buildings** pg. 180
 - d. pulled through underground ducts
6. A loose-tube cable is
 - a. a cable in which fibers are housed in hollow tubes in the cable structure.** Pg.184
 - b. a cable for installation in hollow tubes (ducts) underground.
 - c. cable for installation in indoor air ducts.
 - d. used underwater.
 - e. none of the above
7. Which of the following are usually present in direct-burial cables but not in aerial cables?
 - a. strength members
 - b. outer jacket
 - c. armor** pg. 189

d. fiber housing

8. In what type of cable installation can the cable be blown into place?

a. direct burial

b. underground duct pg. 190

c. military field systems

d. submarine cable

9. The main cause of differences in properties of a fiber before and after cabling is

a. microbending. Pg. 191

b. temperature within the cable.

c. application of forces to the fiber.

d. damage during cabling.

10. The most likely cause of failure of cabled fiber is

a. hydrogen-induced increases in attenuation.

b. corrosion of the fiber by moisture trapped within the cable.

c. severe microbending losses.

d. physical damage to the cable. Pg. 191-192
